Project: Hospital Management System

- **Which pages in your Final Project will include pagination features? Why these? Why not others?**

   My project is a Hospital Management System, so I am assuming that the patient data would require pagination. Also, the staff data might also require pagination, but it can also be separated as doctors, nurses, and other staff so I have not decided on that part.

- **How many rows of data will you need to populate in the database tables in order to test the pagination features?**

   Similar to the EZU project, I would be populating data in my database equivalent to not more than 6-7 pages of navigation.

- **Where will you get or how will you generate the test data values?**

   As my parents are both doctors and maintain many patient records, I am considering leveraging some of their data. Also, there are many open-source test cases available online that I can refer to and use to generate test data values.

- **How could you adapt the data migration code used in the first part of this assignment to load test data values of your own?**

   I can use the similar data migration code used in the first part of this assignment to load my patient records as they can be huge in number.
